Experiment 9 : Index of First Occurrence in a String

Aim

To write a Python program to find the index of the first occurrence of a given character in a string.

Algorithm

1. Start.
2. Read a string and the character to be searched.
3. Traverse the string from left to right.
4. Compare each character with the search character.
5. If a match is found, display its index and stop searching.
6. If no match is found, display -1.
7. Stop.

Source Code

```
def first_occurrence(s, target):
    for i in range(len(s)):
        if s[i] == target:
            return i
    return -1

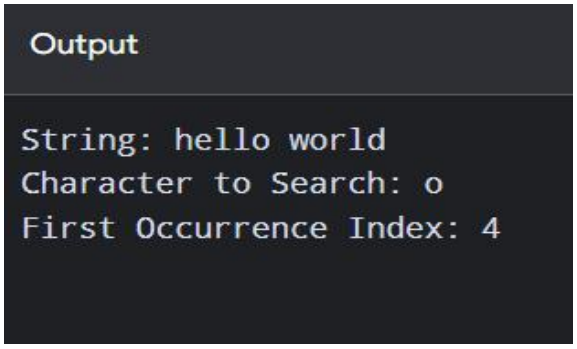

s = "hello world"
target = "o"

result = first_occurrence(s, target)

print("String:", s)
print("Character to Search:", target)

if result != -1:
    print("First Occurrence Index:", result)
else:
        print("Character not found")
```

Output :

Result :

Thus, the Python program was successfully executed, and the index of the first occurrence of the character 'o' in the given string was found to be 4.
